

Real BVM Help: Real-Time Feedback to Improve Ventilation Quality

It's well established that excessive ventilation is often provided to patients today¹

Studies show that over 90% of ventilation today can be either excessive or insufficient² and that the average rate can exceed over 30 ventilations per minute.¹

Poor ventilation quality likely occurs today due to a lack of real-time feedback. ZOLL is proud to introduce Real BVM Help™, a groundbreaking new technology available only on ZOLL's new X Series® Advanced monitor/defibrillator.

Real BVM Help provides clinicians with real-time ventilation feedback on both volume and rate for both intubated and non-intubated patients.

THE NEW ZOLL X SERIES ADVANCED WITH REAL BVM HELP GIVES PROVIDERS:

- Target and delivered ventilation volume
- Target and delivered ventilation rate
- A ventilation quality indicator and countdown timer to guide providers to deliver high-quality ventilations

Real BVM Help works with any standard-sized commercially available airway management device for both intubated and non-intubated patients.

Real BVM Help integrates with existing ZOLL CPR technologies

For cardiac arrest patients, the new X Series Advanced monitor/defibrillator offers both Real CPR Help® and Real BVM Help™, giving providers simultaneous real-time feedback on both CPR and ventilation quality. When used with adult ZOLL CPR electrodes, the X Series Advanced displays the Real BVM Help Dashboard next to the Real CPR Help Dashboard.

Real BVM Help guides rescuers to deliver high-quality ventilations

Guidelines suggest a rate of 10 breaths per minute¹ when ventilating a patient. The average provider has been shown to deliver nearly 3 times that rate.² Real BVM Help provides the real-time feedback clinicians need to deliver high-quality ventilations.

With Real BVM Help on the X Series Advanced, providers can view delivered tidal volume and rate on the monitor. Just as Real CPR Help has been proven to improve CPR quality, clinicians finally have a solution to help improve ventilation quality with Real BVM Help.

Ventilation data from Real BVM Help can be easily reviewed in RescueNet CaseReview® for post-case QA/QI.

The new X Series Advanced works wirelessly with ZOLL's AutoPulse

When the AutoPulse is in use, the X Series Advanced automatically recognizes and displays AutoPulse compressions on the Real BVM Help Dashboard.

Advance your care and provide high-quality ventilation with Real BVM Help. For more information, visit zoll.com/realbvmhelp
